Users and devices place ever-increasing and often unpredictable demands on the wireless network. BYOD brought one wave of device proliferation, and IoT is bringing another.

More devices and data-intensive applications inevitably mean more Wi-Fi traffic. IT teams need ready access to detailed network intelligence to meet high end-user expectations for wireless service levels. Ruckus SmartCell Insight is software that delivers powerful reporting and predictive analytics for Ruckus wireless LAN deployments. It helps enterprises and service providers manage the wireless network more effectively and improve user experience.

**COMPREHENSIVE WIRELESS NETWORK INTELLIGENCE**

The software provides comprehensive network intelligence by collecting and aggregating data from applications, devices, access points and controllers. IT teams get a single unified repository for data related to operation of their wireless deployment. The massive database in SmartCell Insight stores three years of historical data for up to 100,000 wireless access points and millions of clients. A high-performance reporting engine retrieves large data sets quickly and easily, and intuitive data visualization charts help you interpret the information gathered.

SmartCell Insight aids in capacity planning by helping you identify which access points are over- and under-used. It also helps to identify the root causes of lapses in service levels. Detailed wireless network intelligence saves you time with ready access to wireless network data. You can focus on strategic priorities rather than day-to-day wireless service problems.
DEEP INSIGHT WITH STANDARDIZED REPORTS
A wide variety of standardized reports provides visibility into network performance, traffic patterns, application usage and more. Summary views provide high-level information, and you can easily drill down to granular detail at the level of individual network components and devices. Examples of standardized reports include:

- **Device activity**: client profile, client health, number of sessions, number of unique devices, traffic by application, session bytes transferred and leading traffic generators
- **Network operations**: operational status of network elements
- **Inventory**: WLAN controllers, access points, clients, sessions and more
- **Traffic**: access point traffic and top APs by traffic volume
- **AP-specific dashboard**: complete visibility into health and performance
- **Client-specific dashboard**: roaming patterns, connectivity status and Wi-Fi quality of service metrics

The software lets you export reports as raw data, a PDF file or a CSV file. Run reports on demand or schedule them to run at pre-defined intervals for delivery by email. Forward the results to stakeholders inside or outside the organization.

CUSTOMIZABLE DASHBOARDS
The SmartCell Insight Data Explorer tool lets you create customized dashboards for on-the-fly insight into your wireless ecosystem. Drag-and-drop report creation makes it easy to design views tailored to your needs. You can easily position and reposition dashboard tiles, edit tiles at will and toggle between different views. Filter data by a wide variety of attributes—including device, traffic type, application type, controller, access point, band and SSID. You can view data in a pivot table, grid, line chart, bar chart or heat map chart.

PREDICTIVE ANALYTICS
Machine learning algorithms automatically establish a normal behavior envelope for each network element. The system requires no input from IT. Predictive analytics automatically detects anomalous behavior in network elements—thereby enabling IT to proactively address potential service-affecting issues.

VIRTUALIZED DEPLOYMENT
You can deploy the software on-premises in a virtualized environment using VMware, Hyper-V or KVM. You can also deploy as a cloud-based instance on Microsoft Azure, Amazon Web Services or Google Cloud Platform.

APIS FOR EASIER INTEGRATION
SmartCell Insight has a comprehensive set of northbound JSON RESTful APIs that let it easily integrate with a wide range of other platforms. Every chart and table in the standardized reports comes with a corresponding JSON API. The software also provides a user-friendly API Explorer GUI that lets you quickly test out and understand the syntax and parameters for each API endpoint.
